

# Algo Assignment 2

21K-3153

(Q1) ~~assuming that values~~

① Use merge sort  $\Theta(n \log n)$  to sort the list  
 $\text{merge-sort}(\text{list}, \text{target})$

• a b

② position 2 pointers at the ~~beginning~~ and end of the list  
 $\text{left} = 0$   
 $\text{right} = n - 1$

③ add ~~all~~ <sup>elements</sup> values of the pointers. ~~If target sum is greater than~~

Make sure that positions of pointers ~~are~~ are distinct.  
 $\text{sales}[\text{left}] \neq \text{sales}[\text{right}]$

add the values/elements

If the sum of elements is equal to the target, return true.

if  $\text{arr}[\text{left}] + \text{arr}[\text{right}] == \text{target}$  (~~return true~~)

if sum < target, increment left pointer  
 $\text{left}++$

if sum > target, increment right pointer  
 $\text{right}++$

Recurrence Relation:

$$T(n) = 2T\left(\frac{n}{2}\right) + O(n) + O(1) \rightarrow \text{pointer}$$

↓  
merge sort

$$2T\left(\frac{n}{2}\right) + n$$

$$n + 2T\left(\frac{n}{4}\right)$$

$$n + 2\left(\frac{n}{4} + 2T\left(\frac{n}{8}\right)\right)$$

$$2n + 4T\left(\frac{n}{8}\right) \rightarrow 2n + 4\left(\frac{n}{8} + 2T\left(\frac{n}{16}\right)\right)$$

$$3n + 8T\left(\frac{n}{16}\right)$$

$$kn + 2^k T\left(\frac{n}{2^k}\right)$$

$$2^k = n$$

$$n \log n + 2^{\log n} (1)$$

$$\cancel{k} = \log n$$

$$\boxed{n \log n}$$

belongs to  $O(n \log n)$

- ④
- ⑤ ① Use merge sort to sort ONE of the lists in ascending order ( $O(n \log n)$ )  
 merge sort (list2, begin, end)
- ② Traverse every list 1 and subtract ~~the~~ value of element from target ( $O(n)$ )  
 for [j:n]:  
~~for~~  $x = \text{target} - \text{list1}[j]$ .
- ③ attempt to find "x" in list2 through binary search ( $O(\log n)$ ) which makes v traversing every element ( $n$ ) \* binary search ( $\log n$ ) complexity =  
 $\rightarrow n \log n$   
 for [i:n]:  
~~for~~  $x = \text{target} - \text{list1}[i]$   $O(\log n)$   
 binary search (list2, begin, end, x)  $O(\log n)$
- if x is found, return true.  
 Else return false.

## Recurrence Relation

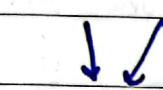

$$2T\left(\frac{n}{2}\right) + O(n)$$

traversing

day / date:

$$O(n) \uparrow (1 + T\left(\frac{n}{2}\right)) \rightarrow \text{binary search}$$

Merge sort:

$$\Theta(2^k)$$

$$kn + 2^k T\left(\frac{n}{2^k}\right)$$

~~$1+1 + T\left(\frac{n}{2}\right)$~~

$$2 + T\left(\frac{n}{2}\right)$$

$$cn \left( \Theta(2^k) \cdot k + T\left(\frac{n}{2^k}\right) \right)$$

$$2^k = n$$

~~$k = \log n$~~

$$n \log n + n \Theta(1) + cn \left( \log n + T\left(\frac{n}{n}\right) \right)$$

$$\begin{aligned} & n \log n + n + n \log n + c \\ & 2n \log n + n + c \end{aligned}$$

belongs to

n log n

(Q 2)

It is understood that ~~list~~ the word will always have odd elements as there can only be 1 unique letter.

~~An approach similar to binary search will be used.~~

~~find mid.~~

Make sure mid is odd.

If mid even, move back

② Compare [mid] to adjacent values.

③ If they match, move

① Find mid. Have 2 left & right pointers.

If mid even, move back to make it odd.

find  $\text{posl}()$ :

$l = 0, \text{right} = n - 1$

if  $\text{left} < \text{right}$ :

$\text{mid} = \lfloor \frac{l+r}{2} \rfloor$

    if  $\text{mid} \% 2 == 0$

~~if~~  $\text{mid} --$

compare mid to adjacent values.

if left value is a match, increment left pointer by 2.

if right value is a match, decrement right pointer by 2.  
not found.

if no match, return position of element

if  $\text{arr}[\text{mid}] == \text{arr}[\text{mid} - 1]$   
 $\text{left} += 2$

if  $\text{arr}[\text{mid}] == \text{arr}[\text{mid} + 1]$   
 $\text{right} -= 2$

else return mid

day / date:

Ans:

similar to binary search.

$$T(n) = T(n/2) + 1$$

$$\textcircled{D} \quad 1 + \left( 1 + T\left(\frac{n}{n}\right) \right)$$

$$2 + T\left(\frac{n}{n}\right) = 2 + \left( 1 + T\left(\frac{n}{8}\right) \right)$$

$$3 + T\left(\frac{n}{8}\right)$$

$$k + T\left(\frac{n}{2^k}\right)$$

$$2^k = n$$

$$k = \log_2 n$$

$$\log n + T(1) = \boxed{\log n + 1} \rightarrow \text{belongs to } \log n$$

day / date:

Q3 Divide Jars into 3 groups.

~~start~~  $\Rightarrow$  func (arr, start, end):  
if start == end  
    return start // heaviest  
else:  
    p = (end - start + 1) / 3

Q4 sum the weights of group 1 and 2, 3 and 3  
Compare weights

x = sum (arr, start, start+p-1)  
y = sum (arr, start+p, start + 2p-1)  
z = sum (arr, start+2p, start + 3p-1)  
Compare weights:  
if ~~x > y~~, heaviest in group 1 or 3  
if  $x > y \& x > z$ :  
    func (arr, start, start+p-1) // 1<sup>st</sup> group  
if  $y > x \& y > z$ :  
    func (arr, start+p, start+2p-1) // 2<sup>nd</sup> group  
else  
    func (arr, start+2p, start+3p-1) // 3<sup>rd</sup> group.

by determining which group has heaviest jar,  
we will recursively find it.

day / date:

RR

$$T(n) = T\left(\frac{n}{3}\right) + \text{constant} T(1)$$

↓  
division in 3

$$1 + \left(1 + T\left(\frac{n}{3}\right)\right)$$

$$2 + \left(1 + T\left(\frac{n}{3}\right)\right)$$

$$3 + T\left(\frac{n}{3}\right)$$

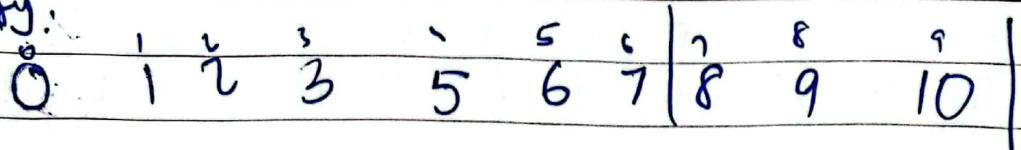

$$\dots k + T\left(\frac{n}{3^k}\right)$$

$$\begin{aligned} 3^k &= n \\ k &= \log_3 n \end{aligned}$$

$$\boxed{\log_3 n + T(1)}$$

belongs to  $O(\log_3 n)$

Ternary:

$$\text{mid1} = \frac{l + (r - l) / 3}{3}$$

key = 10

$$\text{mid2} = r - \frac{(r-l)}{3}$$

$$\text{mid1} = \frac{0 + (9-0)}{3} = [3]$$

$$\text{mid1} = 0 + \frac{(10-0)}{3} = 4$$

$$\text{mid2} = 9 - \frac{(9-0)}{3} = [6]$$

$$\text{mid2} = 10 - \frac{(10-0)}{3} = 10 - 4 = 6$$

key > mid1 & key > mid2  
10 > 3 10 > 7

$$\text{new left index} = 7$$

$$\text{right} = 10 - 9$$

$$\text{left} = \text{mid2} + 1$$

~~right~~

$$\textcircled{1} \quad \text{new mid1} = 7 + \frac{(9-7)}{3} = 7 + 1 = 8$$

$$\text{new mid2} =$$

$$9 - \frac{(9-7)}{3} =$$

key > mid1 & key < mid2

$$9 - 1 = 8$$

$$\textcircled{2} \quad \text{new left} = \text{mid2} + 1 = 8$$

$$\text{right} = 9$$

$$\text{mid1} = 8 + \frac{(9-8)}{3} = 8$$

$$\text{mid2} = 9 - \frac{(9-8)}{3}$$

key > mid1

$$8 \boxed{\text{key} = [\text{mid2}]}$$

$$9 - 0 = 9$$

return mid2

# Meta binary:

0	1	2	3	5	6	7	8	9	10	key = 10

pos

fun

① 0000

$$A[0] != 10$$

f A & Y

pos

② 0001

$$A[1] \neq 10$$

A[1] < 10 f A & 1 < 9

pos

③ 0011

$$A[3] \neq 10$$

A[3] < 10 f 3 < 9

pos

④ 0111

$$A[7] != 10$$

A[7] < 10 f 7 < 9

⑤ 1111

$$A[9]$$

A[9] == 10 ✓

Ternary search reduces the time complexity of binary search as the search space is divided into 3 parts instead of 2 (hence  $O(\log_3 N)$ )

However, if target at extreme ends, in worst case, could perform about the same amount of computations as Binary search

Meta Binary search perform fewer comparison if the target is close to the beginning of list.

If target close to the end, Meta Binary does more comparisons as you saw above  
even more than ternary (5 iterations)

(Q5)

~~QUESTION~~

① make an array ~~of~~ of  $k+1$  size, array X

② take  $n$  integers of  $0 - k$  range as input.

With every integer, increment ~~X~~  $X[\text{input}]$  by 1.  
This will count how many integers of value ~~x~~ 'x'  
are in the input data.

0	1	2	3	.	.	.	$k$
.	+1	+1					+1

③ do a prefix sum of the count array. This means  
add each previous element to current element ~~for~~  
for  $0 \dots k$

0	1	2	3	.	.	$k$
$n^0$	$n^1$	$n^2$	$n^3$	.	.	$n^k$

④ for retrieval in Q(1), simply take  $a$  and  $b$  and  
subtract their respective elements in the count array (Q(1))

$[b] - [a]$  will give numbers between  
 $a$  and  $b$ ,  $b$  included.

$([b] - [a]) - b$  will give numbers between  $a$  &  $b$ ,

• with  $a$  and  $b$  excluded

day / date:

Traversing list of inputted integers is  $O(n)$ .  
~~up~~ ~~of~~

calculating p prefix sum is  $O(k)$

thus  $O(n+k)$

Q6) ihad, abid, afif, fadi, adib, hadi, ibad

We can use bucket sort with our auxiliary array being  $B_{[a \dots i]}$  for our ~~stuck~~ sorting algorithm, using insertion sort will be  $O(n)$  since probability of random variable falling into  $n$  buckets is  $O(1)$ .

1	2	3	4	5	6
a	$a \rightarrow$ abid, afif	b	$a \rightarrow$ abid $\rightarrow$ afif $\rightarrow$ adib	b	$a \rightarrow$ abid, afif, adib
b	b	c	c	c	b
c	c	d	d	d	c
d	d	e	e	e	d
e	e	f	$f \rightarrow$ fadi	e	e
f	f	g	g	$f \rightarrow$ fadi	f
g	g	h	h	$h \rightarrow$ hadi	g
h	had	i	ihad	ihad	h $\rightarrow$ hadi
i	ihad				i $\rightarrow$ had $\rightarrow$ ibad

Sort Brute force insertion ( $O(n)$ )  
 $a \rightarrow$  abid, afif, adib  
 concentrate  $B[j]$ :

b  
 c  
 d  
 e  
 $f \rightarrow$  fadi  
 $g \rightarrow$   
 $h \rightarrow$  hadi  
 $i \rightarrow$  ibad, ibad

$\rightarrow$  abid, adib, afif, fadi, hadi, ibad, i had

$O(n)$  for traversing original array

$O(n)$  for insertion sort of  $B[i]$  lists

thus:  $O(n) + O(n) \Rightarrow O(n)$
